

# Meeting minutes Oct 2, 2014

- All connections were made to try and log into the Raspberry pi
- Need but don't have in box
  1. Extra Ethernet cable
  1. Micro USB to USB cable
- When logging onto Raspberry pi IP address 192.168.2.4 there was no response
- Downloaded putty and pinged the IP address and it was responding. Tried username and password in both internet and from an SSH shell. Nothing was allowing access.
- CMS was assisting us in the network and they recommend hooking up to TV with HDMI and changing the password.
- Missing SD card in one of the Raspberry Pi
- Do TX/RX Antennas need to be connected for it to completely work?
